SKILLS

- Python
- JavaScript / C++
- React & Node.js
- Flask & REST APIs
- SQL, Git & GitHub
- LangChain & LangGraph
- Retrieval-Augmented Generation
- LLM APIs (Gemini, OpenAI)
- Prompt Engineering

EDUCATION

B.Tech, Computer Science (AI/ML)

Noida International University

2025 – 2029

PROFILE

Second-year B.Tech Computer Science (AI/ML) student with hands-on experience across web development and applied GenAI tooling (LangChain, RAG, LLM APIs). Contributed a merged pull request to an active open-source genomics data project and authored a full technical proposal for Google Summer of Code 2026.

PROJECTS

Conversational AI Interview Assistant

- Built a mock-interview web app (Flask backend, JavaScript frontend) that asks subject-based interview questions and generates adaptive follow-ups using conversational memory.
- Implemented an LLM agent with LangChain and LangGraph (Gemini model) using InMemorySaver to retain conversation context across multiple question-answer turns.
- Integrated Murf AI's Falcon text-to-speech API with streaming audio responses for a real-time voice interaction experience.

Agentic RAG Document Q&A System

- Extended a document-based Q&A pipeline (PDF loading, text splitting, Chroma vector store, Hugging Face embeddings) into an agentic system capable of multi-step reasoning.
- Converted a similarity-search retrieval function into a LangChain tool and added a web search tool (Tavily), letting the agent decide dynamically which source to query.

OPEN SOURCE CONTRIBUTIONS

malariagen-data-python (MalariaGEN Vector Observatory)

PR #1112, Merged

- Authored and contributed a Windows environment setup guide after identifying that only Linux/macOS instructions existed in the repository.
- Documented the full setup process and a troubleshooting section based on real errors encountered; guide was reviewed and merged by the project maintainer.

GOOGLE SUMMER OF CODE

Applicant — MalariaGEN Vector Observatory

GSoC 2026

- Authored a technical proposal to build a natural-language interface over the malariagen_data genomic API, allowing non-programmers to query mosquito genomic data using plain English.
- Proposed architecture combined LLM-based query understanding, dynamic Python code generation, and safe code execution against the existing API.

HACKATHONS

- OpenAI-affiliated Hackathon — Built a civic-issue reporting website concept for identifying and flagging road faults such as potholes.
- Adobe Hackathon / Recruitment Process — Cleared the first round (data structures and algorithms assessment).
